ABSTRACT

In today's era we see a lot of students pursuing their education. In the past decade the number of students pursuing graduate education has rapidly increased. Each applicant has to face a tough competition to get admission in their dream university. Generally as the students don't have much idea about the procedures, requirements and details of the universities. They seek help from the education consultancy firms to help them successfully secure admission in the universities which are best suitable for their profile, for this they have to invest huge amount of money as consultancy fees. Apart from these the education consultancy firms there are few websites and blogs that guide the students on the admission procedures. The drawback of the currently available resources is that they are very limited and also they are not truly dependable taking into consideration of their accuracy and reliability. The aim of this research is to develop a system using Applied Data Science and Machine learning algorithms. We will name it as University Admit Eligibility Predictor (UAEP). It will help the students to identify the chances of their application to an university being accepted. Also it will help them in identifying the universities which are best suitable for their profile and also provide them with the details of those universities. A simple user interface will be developed for the users to access the UAEP system.

1. INTRODUCTION:

1.1 Project overview:

This University Admit Eligibility Predictor is used to predict the Percentage of a Student Getting a chance to join the university . By using CGPA , GRE Grade we can calculate the student chances.

1.2 Purpose:

Easy way for a student to Know his/her Chances to getting Seats in Universities. Effective one in this Modern Day Technology World.

2. LITERATURE SURVEY

2.1 Existing Problem:

For a University Admission Predictor there are some problem will arise because of the university Rules or Guidelines they Follow. Like The Grade Score acquired by the students . By using this predictor Student Easily Knows the Chances of Preferred University.

2.3 Problem Statement:

This is a Requirements Specification Document for a new Data science-based University Admit Eligibility Predictor . It is an AI based application that asks for the users to input their academic transcripts data and calculates their chances of admission into the University Tier that they selected. It also provides an analysis of the data and shows how chances of admissions can depend on various factors. This document describes the scope, objectives and goals of the system. In addition to describing the non-functional requirements.

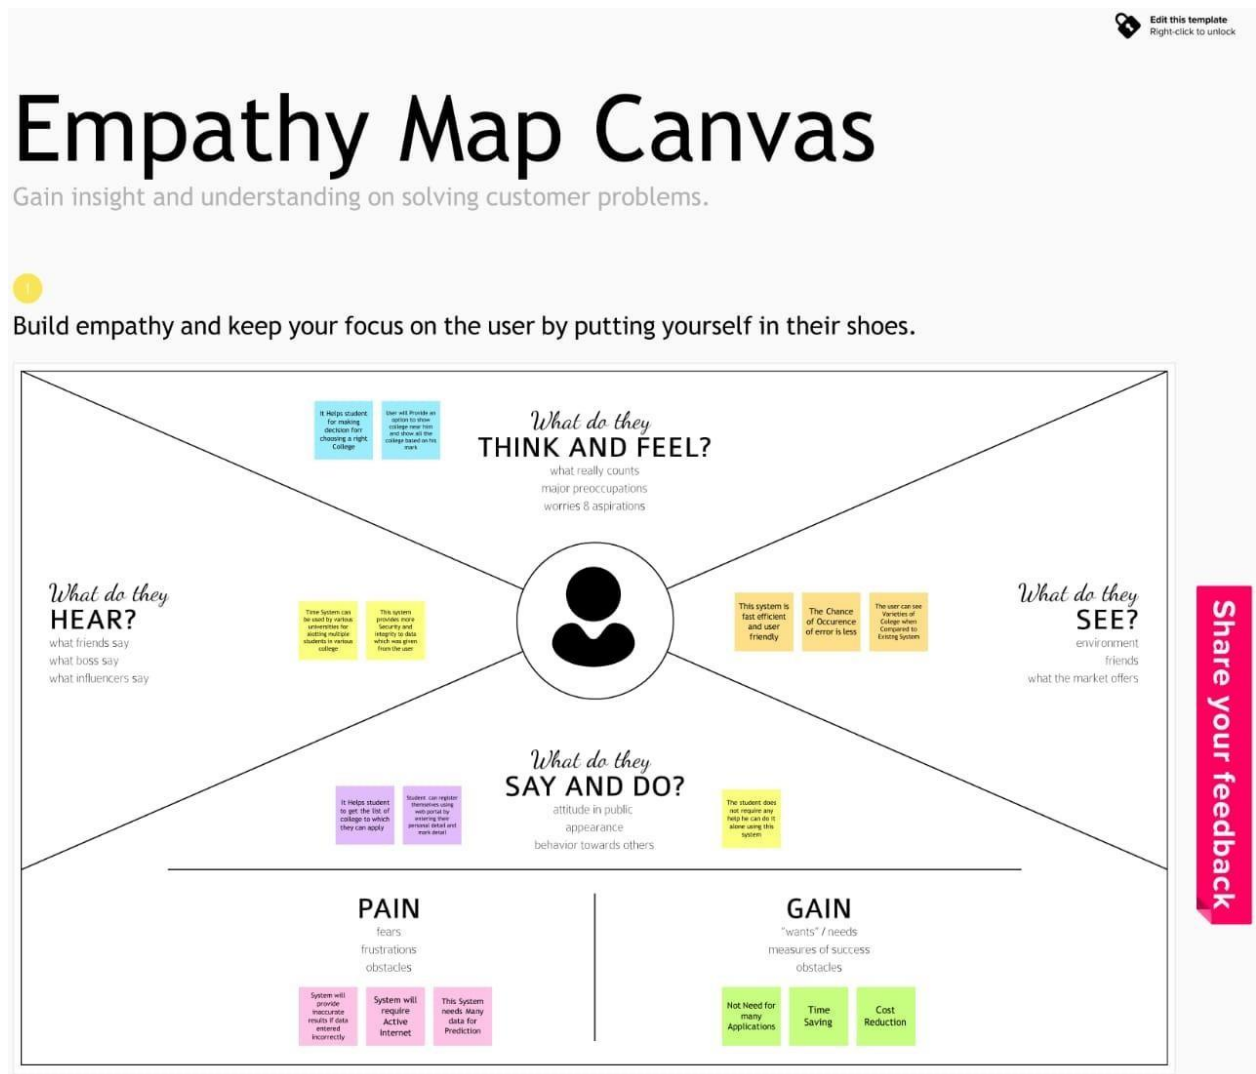

In order to get admitted to these universities, a set of academic requirements are needed. However, because of the sheer number of universities of different levels, students are often stuck in a dilemma till the very last minute as to whether or not their applications will be accepted or not as no concrete documentation is available which lists the requirements.

Our AI Model that was built after considering many leading Machine Learning Algorithms, to provide the most accurate prediction of how much of a chance of admissions does a student's current grades and other academic transcripts allow them in the tier of universities of their choice.

A Database will also be implemented for the system so that students can save their data and review and edit it as they progress with the most recent predictions being saved with their profile.

3.IDEATION AND PROPOSED SOLUTION:

3.1 Empathy Map Canvas:

3.2 Ideation and Brain Storming:

Idea prioritization

Use this framework to rank ideas based on their feasibility and impact to visually compare the merits of multiple ideas. Deliver a set of ideas that your team wants to try out, and identify which of them need to be prioritized.

1

Collect your ideas in one place

Jot down different ideas your team is interested in trying out. These could be different solutions, or different approaches to the same solution. As a team, go through the ideas in the idea bank one by one and place them on the grid. Take the time to discuss each idea and come to a consensus on where it should go.

Conducting a brainstorm

Conducting a brainstorm with others is a great way to generate ideas. It's a process where you and your team sit down and think of as many ideas as possible. The goal is to generate a large number of ideas, even if they are not perfect. The ideas are then evaluated and the best ones are chosen.

3.3 Proposed Solution

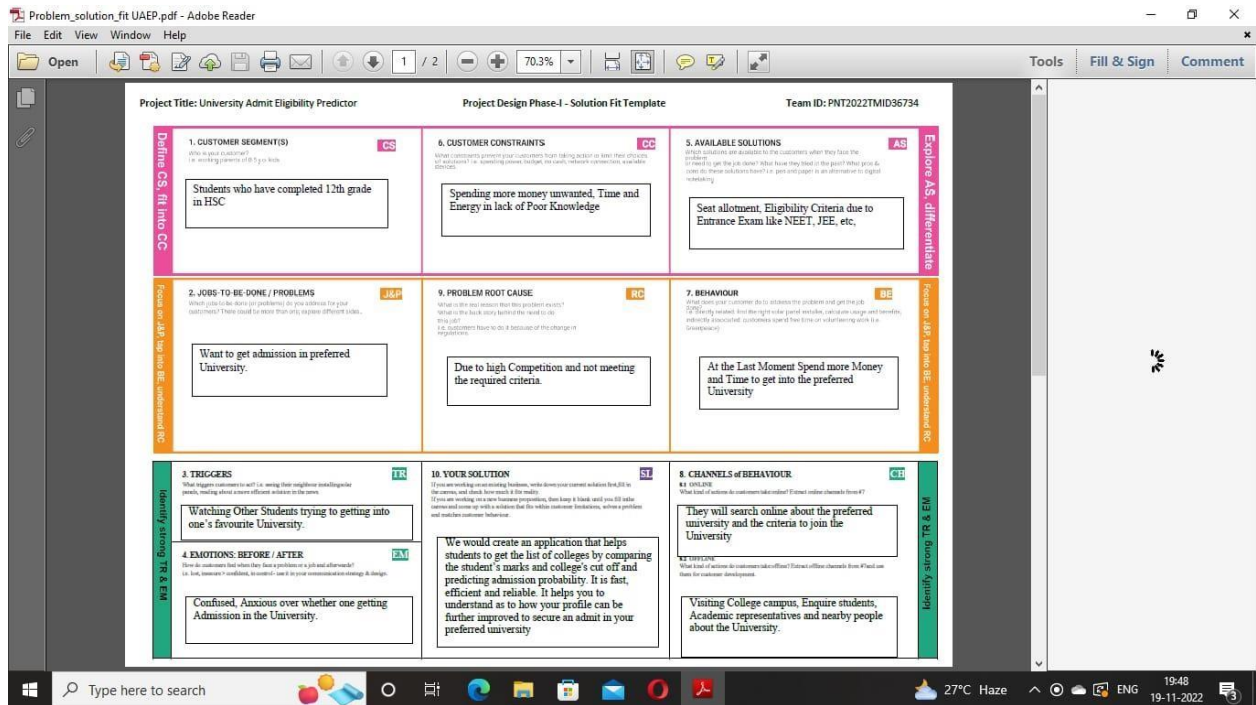

This project aims at developing an application that uses machine learning-based algorithms to determine the feasibility of a particular student's profile being eligible for university admission. The main objective is to save the time and money spent by the students at education consultancy firms. Moreover, if the students apply only to those universities where he/she has a genuine chance of admission would reduce the application process.

Our project will assist UG graduates in getting into shortlisted colleges for master's programmes based on their GRE, CGPA, and TOEFL scores. If the expected production gives them a good picture of their prospects of admission to the university. This study will also assist students who are presently preparing to have a better understanding. It will also provide students with information on the university's research prospects, admissions procedure, courses offered, and noteworthy alumni.

The project website can identify numerous amenities available at universities and provide directions to the university where it is located. You can also apply for scholarships and financial aid. By using Machine learning models like Regression models, the probability of a student getting admission at a desired university is predicted.

The solution proposed will be deployed as web-application. So, it is easily accessible by anyone who has internet services and has no specific software and hardware specifications. The dataset used for model training can be scale according to the available universities admission data.

3.4. Problem Solution Fit

4.REQUIREMENT ANALYSIS:

Requirements analysis, also called requirements engineering, is the process of determining user expectations for a new or modified product. These features, called requirements, must be quantifiable, relevant and detailed. In software engineering, such requirements are often called functional specifications. Requirements analysis is critical to the success or failure of a systems or software project. The requirements should be documented, actionable, measurable, testable, traceable, related to identified business needs or opportunities, and defined to a level of detail sufficient for system design.

4.1 Functional Requirements:

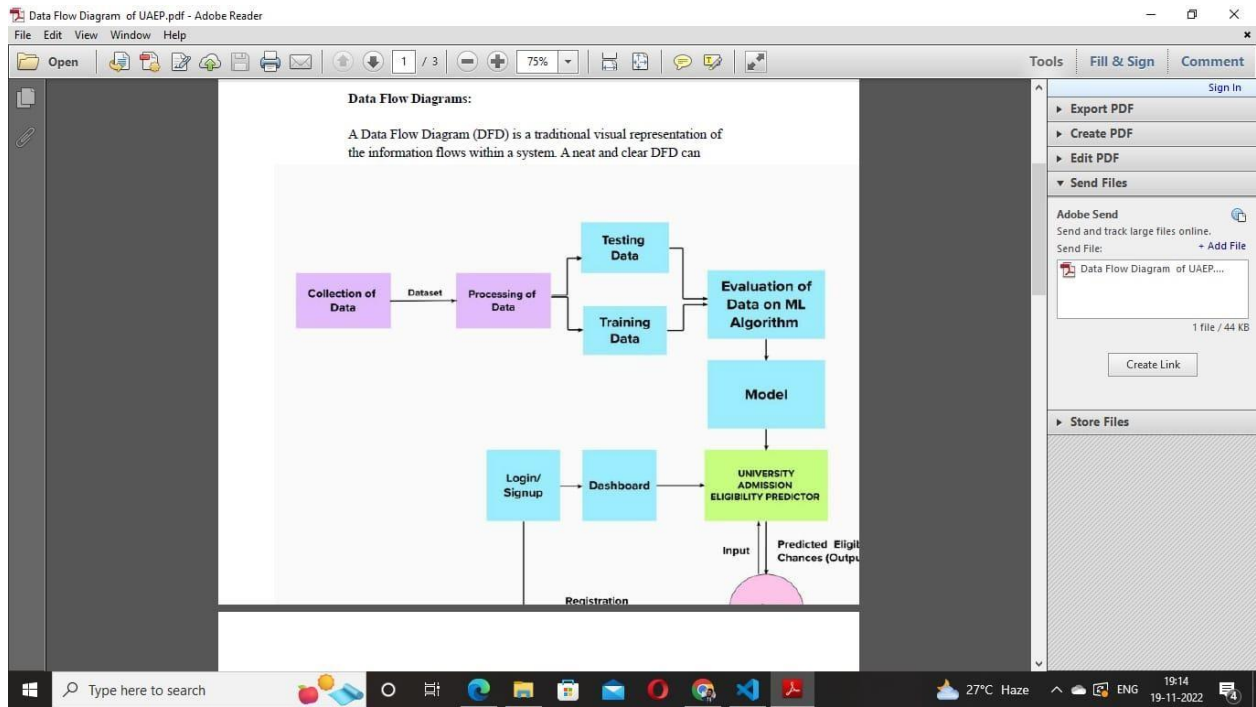

- Prediction
- Input form
- Percentage of chance

4.2 Non-Functional Requirements:

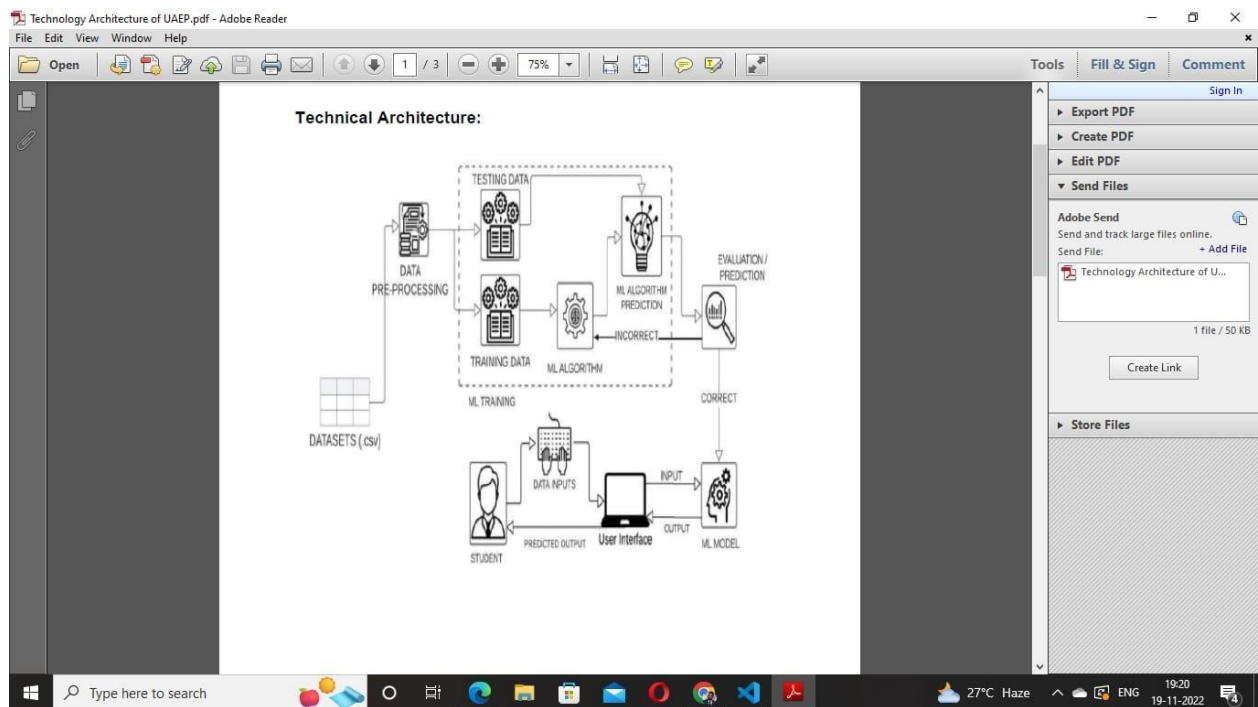

- Speed
- Security
- Portability
- Compatibility
- Capacity
- Reliability
- Environment
- Localization

5 .Project Design:

5.1 Data Flow Diagrams:

5.2 Solution and Technical Architecture:

5.3 User Stories

A user story is an informal, natural language description of features of a software system. They are written from the perspective of an end user or user of a system, and may be recorded on index cards, Post-it notes, or digitally in project management software.[1] Depending on the project, user stories may be written by different stakeholders like client, user, manager, or development team.

6 .PROJECT PLANNING AND SCHEDULING:

6.1 Sprint planning and Estimation:

PLANNING	Planning all the modules and features which are going to implement
REQUIREMENTS	We decided what are the software's and tools we need and install the required resources
DESIGN	We design all the modules like login page, dashboard, Academic details form etc.,
DEVELOPMENT	We are going to develop the predictor which uses the previous dataset and academic data of student. In this phase we use some algorithm for prediction
TESTING	We are going to test the model if we face any error we debug the error
DEPLOYMENT	Finally we submit the project in GitHub

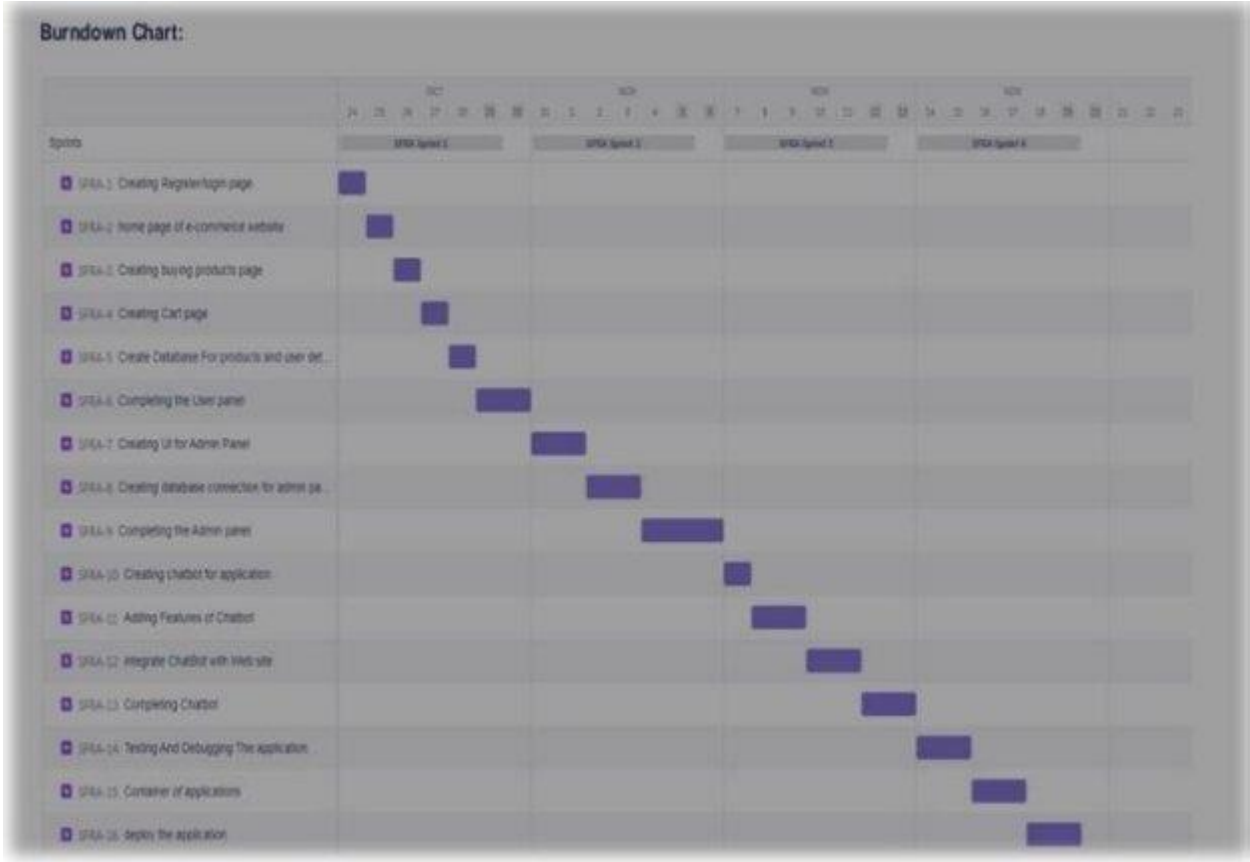

6.2 Sprint delivery Schedule:

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Registration	USN-1	As a user, I can register for the application by	2	High	
Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
			entering my email, password, and confirming my password.			
Sprint-1		USN-2	As a user, I will receive confirmation email once I have registered for the application	1	High	
Sprint-2		USN-3	As a user, I can register for the application through Facebook	2	Low	
Sprint-1		USN-4	As a user, I can register for the application through Gmail	2	Medium	

Sprint-1	Login	USN-5	As a user, I can log into the application by entering email & password	1	High	
	Dashboard					

Use the below template to create product backlog and sprint schedule

8	308	101	2	3	4	2.9	0	0.68
9	302	100	1	2	1.5	3	0	0.5
10	323	108	3	3.5	3	3.6	0	0.85
11	325	106	3	3.5	4	3.4	1	0.82
12	327	111	4	4	4.5	3	1	0.84
13	328	112	4	4	4.5	3.1	1	0.78
14	307	109	3	4	3	3	1	0.62
15	211	104	3	3.5	2	3.2	1	0.61
16	314	105	3	3.5	2.5	3.3	0	0.64
17	317	107	3	4	3	3.7	0	0.66
18	219	106	3	4	3	3	1	0.65
19	318	110	3	4	3	3.8	0	0.69
20	303	100	3	3.5	3	3.5	0	0.62
21	312	107	3	3	2	2.9	1	0.64
22	325	114	4	3	2	3.4	0	0.7
23	328	116	5	5	5	3.5	1	0.94
24	334	119	5	5	4.5	3.7	1	0.95
25	336	119	5	4	3.5	3.8	1	0.97
26	340	120	5	4.5	4.5	3.6	1	0.94
27	322	109	5	4.5	3.5	3.8	0	0.76

8.2 User Acceptance Testing:

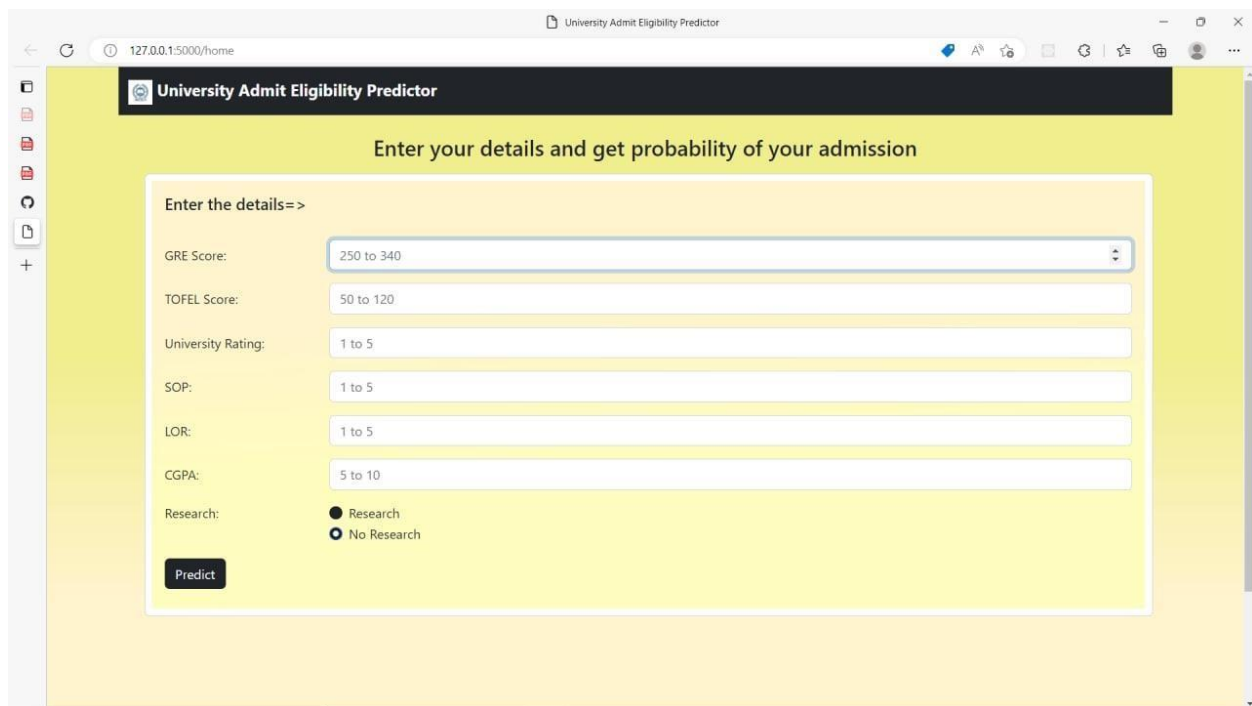

User Acceptance Testing (UAT) is a type of testing performed by the end user or the client to verify/accept the software system before moving the software application to the production environment. UAT is done in the final phase of testing after functional, integration and system testing is done.

The User Acceptance of this product is not surveyed enough to give a solid conclusion. The theoretical and hypothetical acceptance is calculated to be high enough to conclude that this product is usable and valuable.

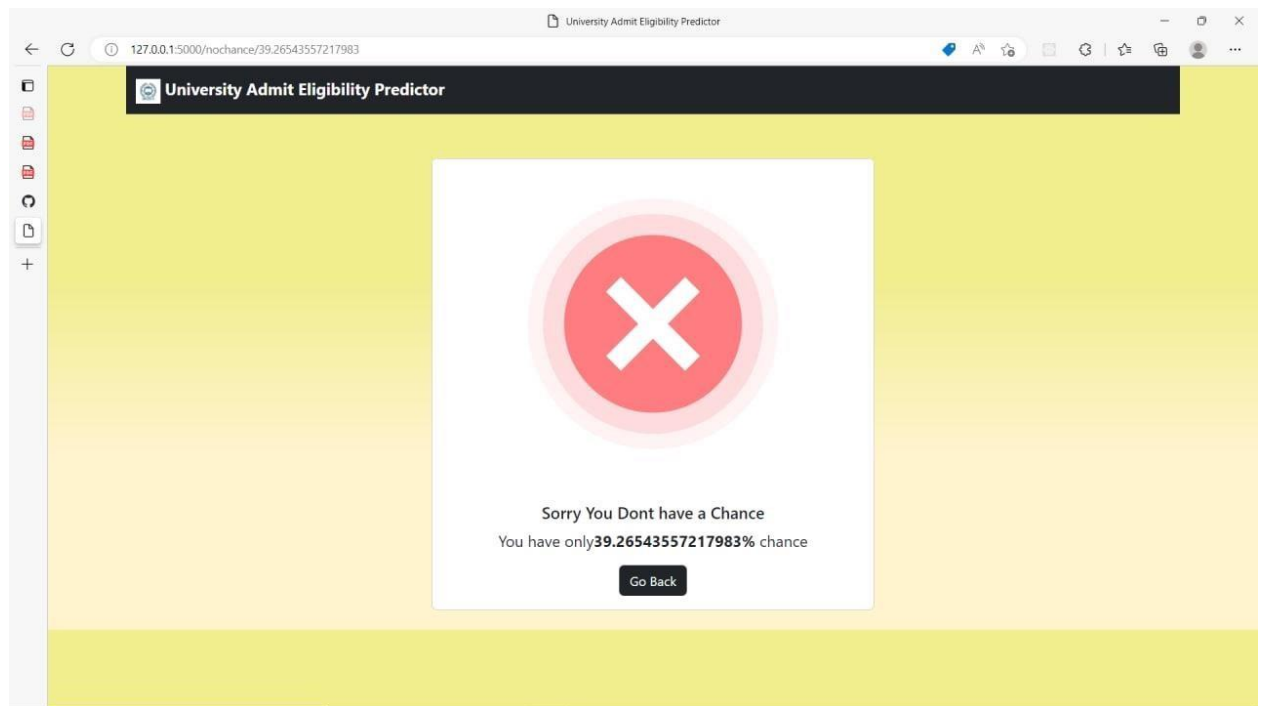

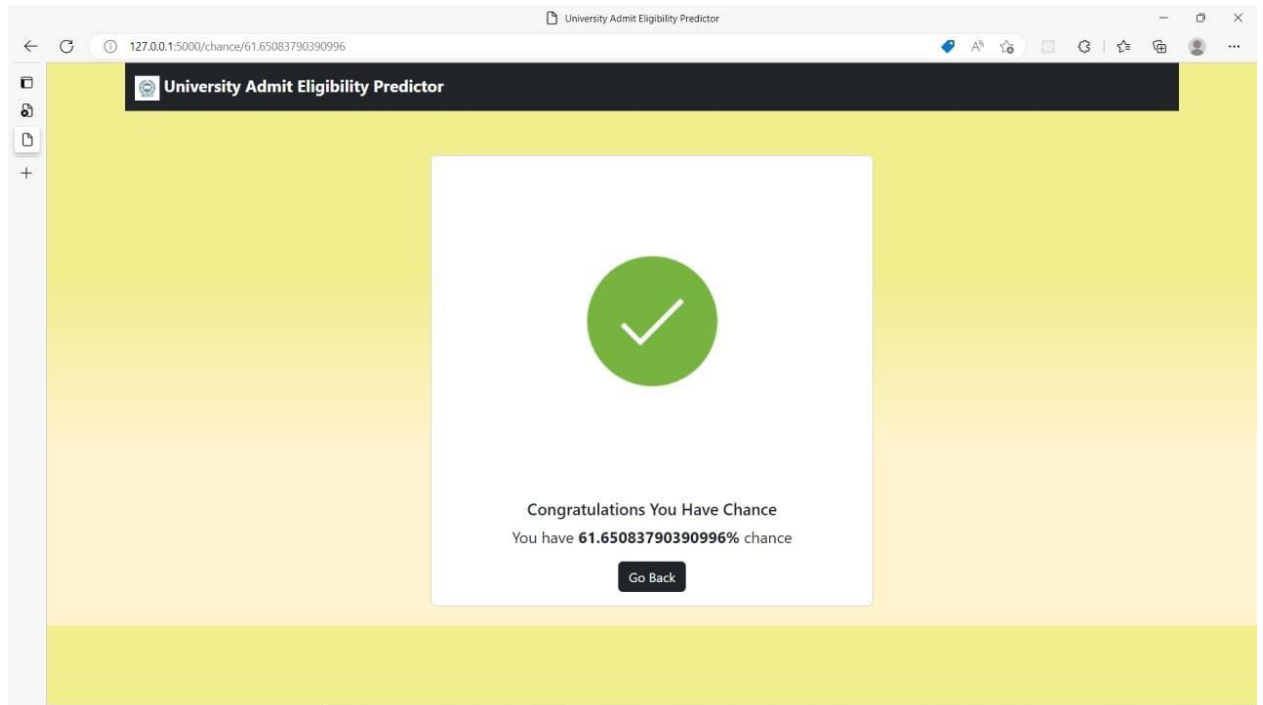

9.RESULTS:

9.1 Performance Metrics

The Performance is the Accuracy of the model trained. The training accuracy of the model is 92%. The testing accuracy of the model is 89%.

The screenshot shows a web browser window with the title "University Admit Eligibility Predictor". The address bar shows the URL "127.0.0.1:5000/home". The page has a yellow background and a dark header bar with the title. Below the header, there is a subtitle "Enter your details and get probability of your admission". The main content area is a white box with the heading "Enter the details=>". It contains several input fields: "GRE Score:" with a range of "250 to 340", "TOFEL Score:" with a range of "50 to 120", "University Rating:" with a range of "1 to 5", "SOP:" with a range of "1 to 5", "LOR:" with a range of "1 to 5", and "CGPA:" with a range of "5 to 10". There is also a "Research:" section with two radio buttons: "Research" (selected) and "No Research". A "Predict" button is located at the bottom left of the form.

10. ADVANTAGES &DISADVANTAGES

- **ADVANTAGE** 1. Know the percentage 2.Lower investigation 3.Provide Relevant Material
4. Reduce time consumption
5. Good user experience
- **DISADVANTAGE**
 1. Significiant investments required.
 2. Inable to capture changes
 3. Privacy concerns

11. CONCLUSION

We have successfully developed an application using python flask, HTML,CSS. By using the application we can predict weather we can get admission in the desired University or not.

12. FUTURESCOPE

In future we would like to enhance the existing model in such a way that consumer feels the same way when purchasing in store using Virtual reality and other upcoming technologies. Research to improve the accuracy of the system is under progress.
